

ZC210 - HTR

The new Hunting/Tactical Reticle (HTR) from ZCO was specifically developed to provide crossover features for the Zero Compromise Optic 2-10X30 rifle scope.

The center point of aim has a large aiming circle that stands out at 2X for close range hunting or tactical engagements. The heavy bars to the left and right help bracket the target into the aiming circle which measures 18 inches diameter at 200 yards. This helps with basic range estimation in open country while simultaneously providing a fast and easy hold in close encounters.

The hold-over tree is minimally sized so that it essentially disappears at low magnification but becomes visible for holding elevation and wind at higher magnifications. The dot and circle design makes precise holds easy at the high magnification of 10X while not being overly busy or covering too much of the target area.

This reticle design allows the ZC210 to be well suited to a multitude of tasks from hunting to tactical applications for military or law enforcement.
